

Human Development Index (HDI) Predictor
Brainstorm & Idea Prioritization

Project Name: Human Development Index (HDI) Predictor

Domain: Machine Learning

Problem Statement: Many countries have different levels of development based on health, education, and income. Predicting the Human Development Index (HDI) helps understand a country's development level using these indicators.

Objective: To build a Machine Learning model that predicts the Human Development Index (HDI) using Life Expectancy, Education Index, and Income Index.

Team Member: Hemavathi Chakali

Brainstorm Ideas

Idea	Description
Predict Human Development Index	Predict the Human Development Index (HDI) using Machine Learning based on Life Expectancy, Education Index, and Income Index.
Country Development Analysis	Compare the development levels of different countries using HDI values.
Data Visualization	Display charts and graphs to understand development indicators easily.
Web-Based Prediction System	Develop a Flask web application where users can enter values and get the predicted HDI instantly.

Idea Prioritization:

Selected Idea: Human Development Index (HDI) Predictor

Reason for Selection: The Human Development Index (HDI) Predictor was selected because it provides an easy and accurate way to predict a country's HDI using Machine Learning. The project analyzes important development indicators such as Life Expectancy, Education Index, and Income Index. It helps users understand and compare development levels quickly through a simple web application.
