

Define Problem Statement:

Project Name: Human Development Index (HDI) Predictor

Problem Statement:

Many countries have different levels of development based on health, education, and income. Calculating and analyzing the Human Development Index (HDI) manually can be difficult and time-consuming. There is a need for a simple system that predicts the HDI quickly and accurately using Machine Learning.

Customer:

Students, researchers, government organizations, and people interested in analyzing a country's development.

Need:

Users need an easy-to-use web application that predicts the Human Development Index using key development indicators without performing complex calculations.

Proposed Solution:

Develop a Machine Learning-based web application that accepts Life Expectancy, Education Index, and Income Index as inputs and predicts the Human Development Index (HDI) accurately.

Benefits:

Fast and accurate HDI prediction.

Easy to use through a web application.

Helps understand a country's development level.

Supports learning and research in data analysis and Machine Learning.
