

Problem Solution Fit

Project Name

Human Development Index (HDI) Predictor

Introduction

The Human Development Index (HDI) is an important indicator used to measure a country's development based on health, education, and income. Manual calculation and analysis can be difficult and time-consuming. This project uses Machine Learning to simplify the prediction process.

Problem Statement

Many users find it difficult to analyze and predict the Human Development Index (HDI) manually. Existing methods require technical knowledge, data analysis skills, and significant time.

Proposed Solution

The proposed solution is to develop a Machine Learning-based web application that predicts the Human Development Index (HDI) using **three input parameters**:

Life Expectancy

Education Index

Income Index

The application provides instant and accurate HDI predictions through a simple web interface.

Problem–Solution Fit

Problem	Solution
Manual HDI calculation is difficult	Machine Learning automates the prediction
Calculations take more time	Instant prediction through a web application
Complex analysis for users	Simple and user-friendly interface
Need for accurate results	Trained Machine Learning model provides reliable predictions

Benefits

- Fast prediction
- Accurate results
- Easy to use
- Saves time
- Supports students, researchers, and analysts
- Accessible through a web browser

Expected Outcome

The application should successfully predict the Human Development Index (HDI) accurately and help users understand the development level of a country using key development indicators.
